

Exploratory Gaussian correlation sweep: all tested correlations

Empirical RMSE-minimizing ℓ : green matches the fixed bound rule

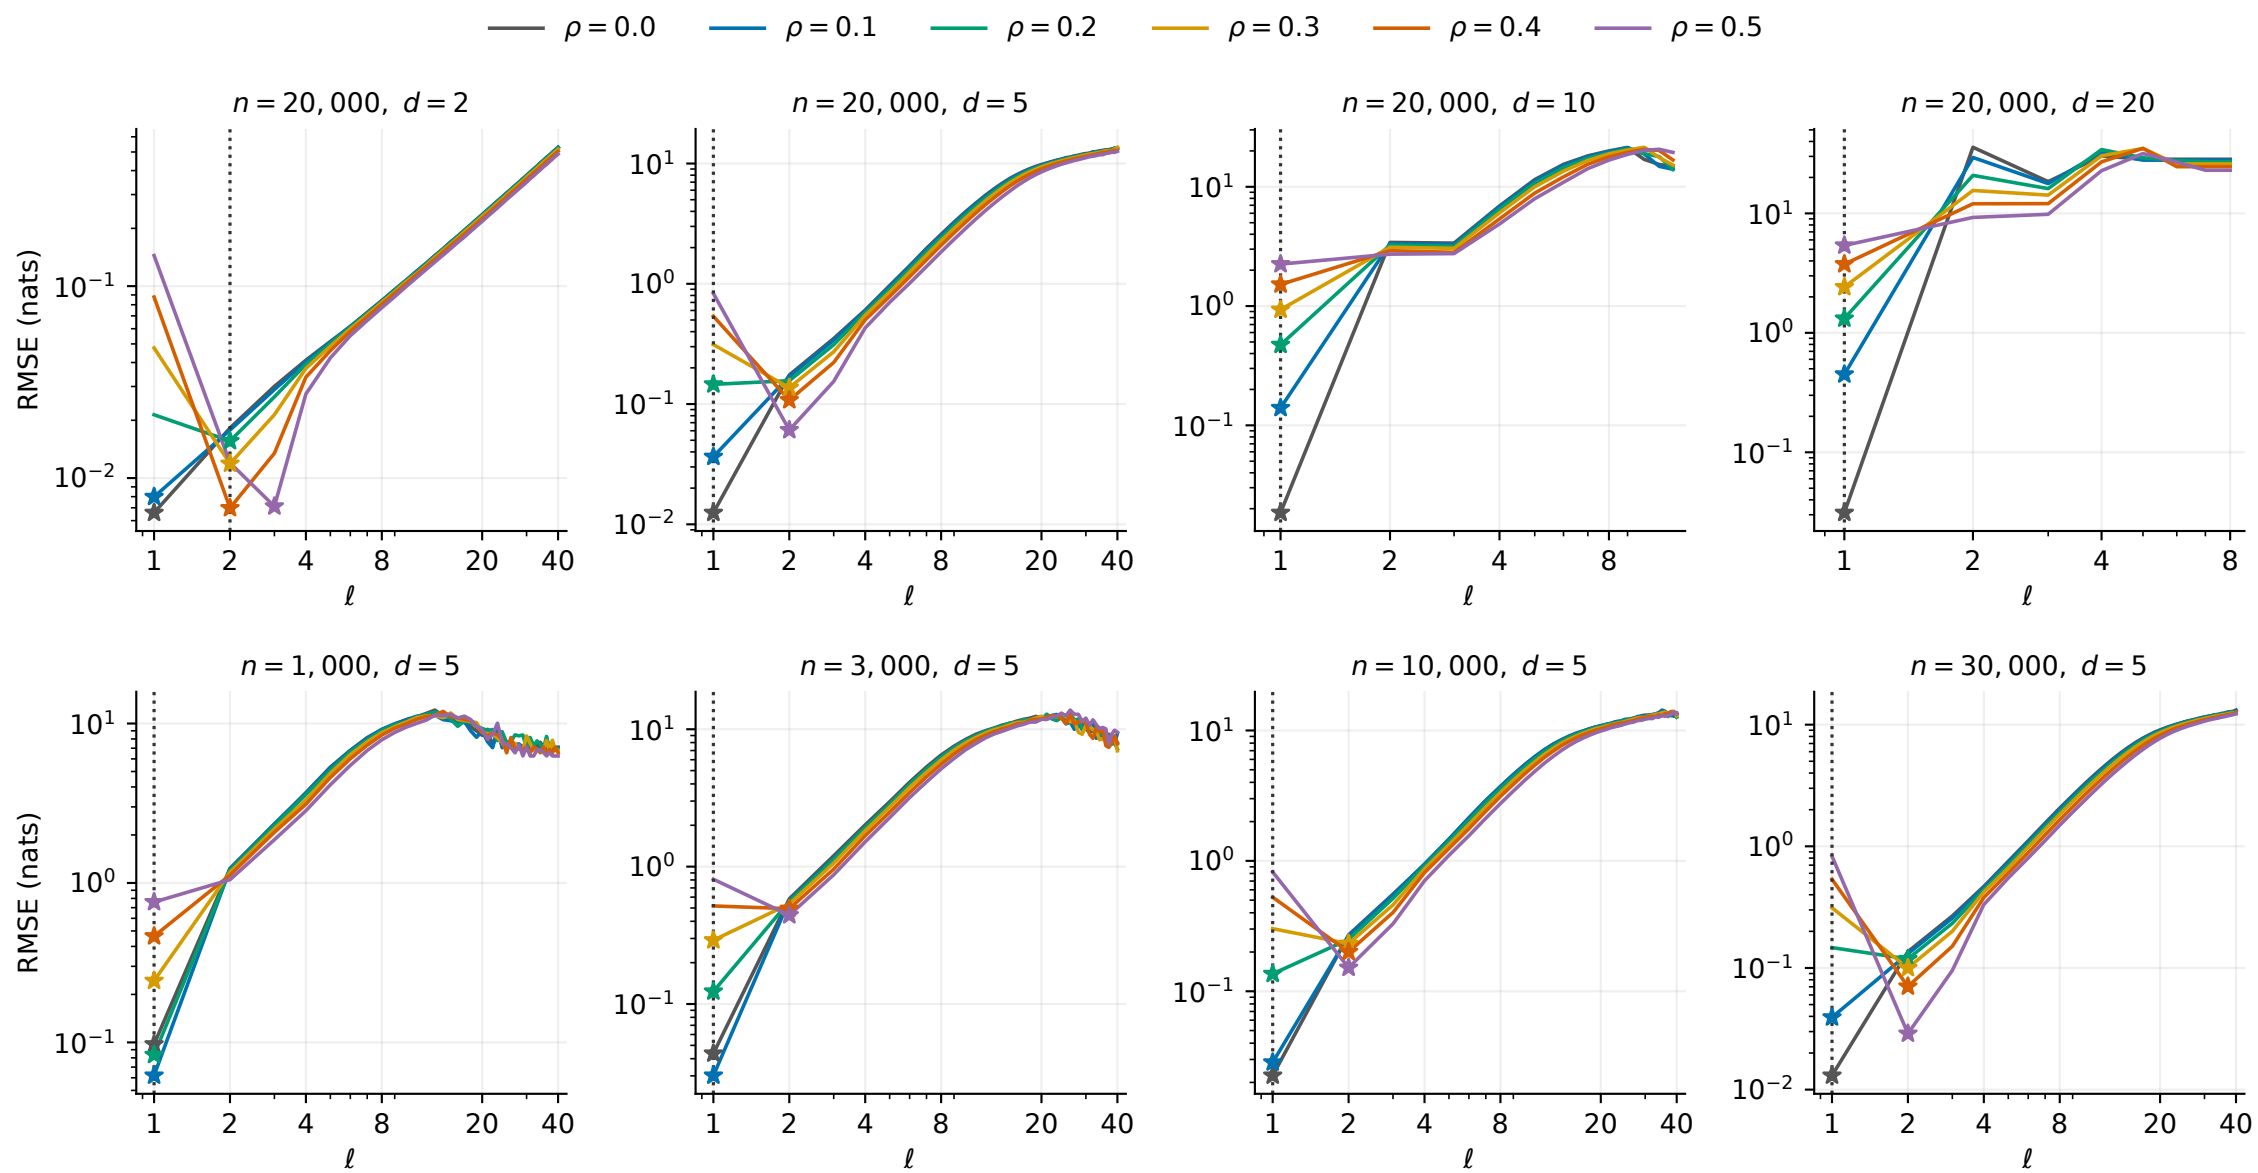

Bound-rule levels by column: 2, 1, 1, 1 | 1, 1, 1, 1. Rate C=1: 1 in every column.

30 repetitions per condition; all saved ell candidates, no coverage filter. rho=0 is an independence control.

Theoretical rules are unchanged. Greater agreement under weaker dependence is not a finite-sample optimality proof.

Gaussian ell-RMSE curves across the full correlation sweep

Stars: empirical grid minima. Dotted vertical line: fixed bound minimum. Curves include all candidates and repetitions.

Fine partitions may skip observations; the canonical estimator averages covered points. Gaussian data are outside theorem assumptions.
